

CSCI 104 Priority Queues / Heaps

Mark Redekopp
David Kempe
Sandra Batista

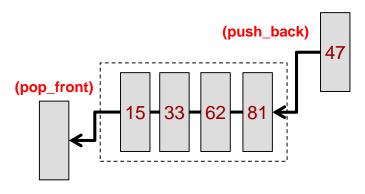

PRIORITY QUEUES

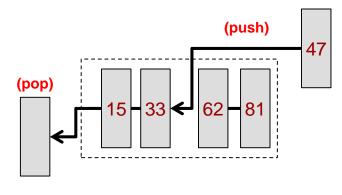

Traditional Queue

- Traditional Queues
 - Accesses/orders items based on POSITION (front/back)
 - Did not care about item's VALUE
- Priority Queue
 - Orders items based on VALUE
 - Either minimum or maximum
 - Items arrive in some arbitrary order
 - When removing an item, we always want the minimum or maximum depending on the implementation
 - Heaps that always yield the min value are called min-heaps
 - Heaps that always yield the max value are called max-heaps
 - Leads to a "sorted" list
 - Examples:
 - Think hospital ER, air-traffic control, etc.

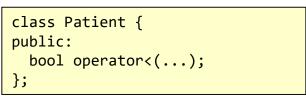

Traditional Queue

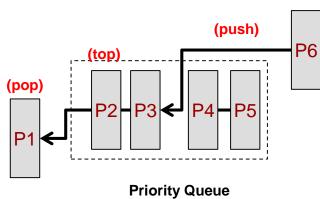

Priority Queue

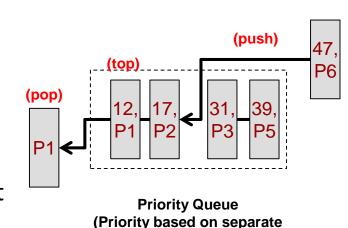

Priority Queue

- What member functions does a Priority Queue have?
 - push(item) Add an item to the appropriate location of the PQ
 - top() Return the min./max. value
 - pop() Remove the front (min. or max) item from the PQ
 - size() Number of items in the PQ
 - empty() Check if the PQ is empty
 - [Optional]: changePriority(item, new_priority)
 - Useful in many algorithms (especially graph and search algorithms)
- Priority can be based on...
 - Intrinsic data-type being stored (i.e. operator<()
 of type T)
 - Separate parameter from data type, T, and passed in which allows the same object to have different priorities based on the programmer's desire (i.e. same object can be assigned different priorities)

(Priority based on intrinsic property of the data)

priority parameter)

Priority Queue Efficiency

- If implemented as a sorted array list
 - Insert() = _____
 - Top() = _____
 - Pop() = _____
- If implemented as an unsorted array list
 - Insert() = _____
 - Top() = _____
 - Pop() = _____

Priority Queue Efficiency

- If implemented as a sorted array list
 - [Use back of array as location of top element]
 - -Insert() = O(n)
 - $\operatorname{Top}() = \operatorname{O}(1)$
 - Pop() = O(1)
- If implemented as an unsorted array list
 - -Insert() = O(1)
 - Top() = O(n)
 - Pop() = O(n)

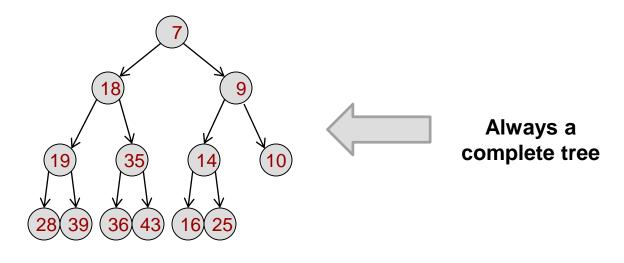

HEAPS

Heap Data Structure

- Provides an efficient implementation for a priority queue
- Can think of heap as a complete binary tree that maintains the heap property:
 - Heap Property: Every parent is less-than (if min-heap) or greater-than (if max-heap) both children, but no ordering property between children
- Minimum/Maximum value is always the top element

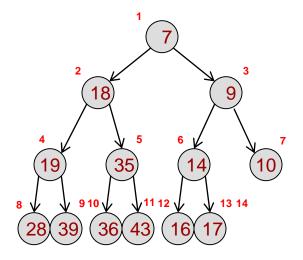

Heap Operations

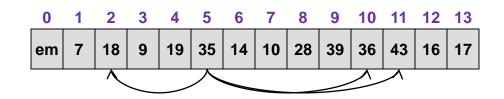

- Push: Add a new item to the heap and modify heap as necessary
- Pop: Remove min/max item and modify heap as necessary
- Top: Returns min/max
- Since heaps are complete binary trees we can use an array/vector as the container

```
template <typename T>
class MinHeap
{ public:
   MinHeap(int init_capacity);
   ~MinHeap()
   void push(const T& item);
   T& top();
   void pop();
   int size() const;
   bool empty() const;
  private:
   // Helper function
   void heapify(int idx);
   vector<T> items_; // or array
```

Array/Vector Storage for Heap

- Recall: A complete binary tree (i.e. only the lowest-level contains empty locations and items added left to right) can be modeled as an array (let's say it starts at index 1) where:
 - Parent(i) = i/2
 - Left_child(p) = 2*p
 - Right_child(p) = 2*p + 1

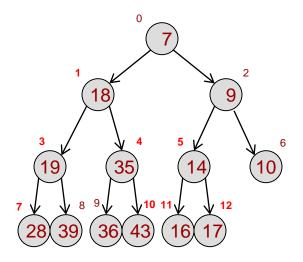

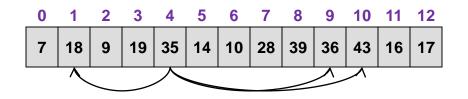

Parent(5) =
$$5/2 = 2$$

Left(5) = $2*5 = 10$
Right(5) = $2*5+1 = 11$

Array/Vector Storage for Heap

- We can also use 0-based indexing
 - Parent(i) = _____
 - Left_child(p) = _____
 - Right_child(p) = _____

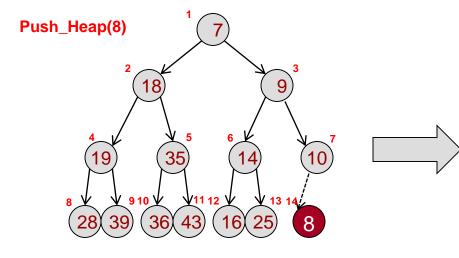

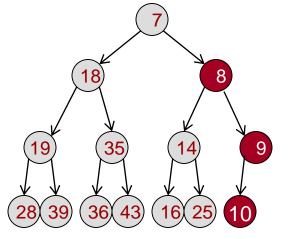

Push Heap / TrickleUp

- Add item to first free location at bottom of tree
- Recursively promote it up while it is less than its parent
 - Remember valid heap all parents
 children...so we need to promote
 it up until that property is satisfied

```
void MinHeap<T>::push(const T& item)
{
   items_.push_back(item);
   trickleUp(items_.size()-1);
}

void MinHeap<T>::trickleUp(int loc)
{
   // could be implemented recursively
   int parent = _____;
   while(parent _____ &&
        items_[loc] ___ items_[parent] )
   { swap(items_[parent], items_[loc]);
        loc = ____;
        parent = ____;
   }
   Solutions at the
   end of these slides
```

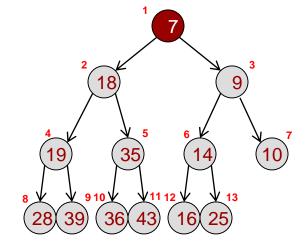

top()

 top() simply needs to return first item

```
T const & MinHeap<T>::top()
{
   if( empty() )
     throw(std::out_of_range());
   return items_[1];
}
```

Top() returns 7

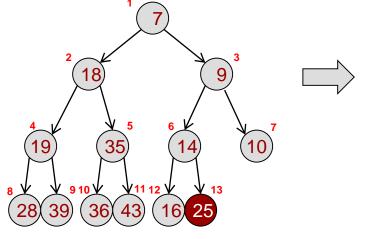

Pop Heap / Heapify (TrickleDown)

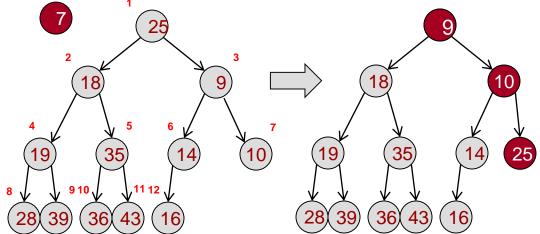

- Pop utilizes the "heapify" algorith (a.k.a. trickleDown)
- Takes last (greatest) node puts it in the top location and then recursively swaps it for the smallest child until it is in its right place

```
void MinHeap<T>::pop()
{ items_[1] = items_.back(); items_.pop_back()
  heapify(1); // a.k.a. trickleDown()
}
```

```
void MinHeap<T>::heapify(int idx)
{
   if(idx == leaf node) return;
   int smallerChild = 2*idx; // start w/ left
   if(right child exists) {
      int rChild = smallerChild+1;
      if(items_[rChild] < items_[smallerChild])
           smallerChild = rChild;
   }
   if(items_[idx] > items_[smallerChild]){
      swap(items_[idx], items_[smallerChild]);
      heapify(smallerChild);
} }
```

Pop()

Building a heap out of an array

HEAPSORT

Using a Heap to Sort

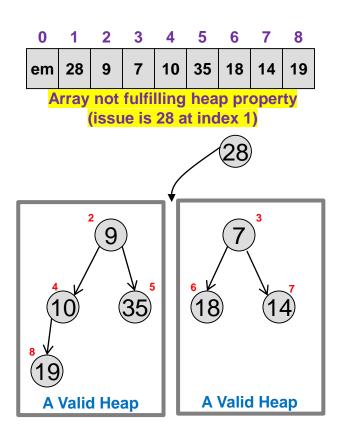

- If we could make a valid heap out of an **arbitrary array**, could we use that heap to **sort** our data?
- Sure, just call top() and pop() *n* times to get data in sorted order
- How long would that take?
 - **n** calls to: $top()=\Theta(1)$ and $pop()=\Theta(\log n)$
 - Thus total time = Θ(n * log n)
- But how long does it take to convert the array to a valid heap?

Array after top/popping the heap n times

- We can convert an unordered array to a heap
 - std::make_heap() does this
 - Let's see how...
- Basic operation: Given two heaps we can try to make one heap by unifying them with some new, arbitrary value but it likely won't be a heap
- How can we make a heap from this non-heap
- Heapify!! (we did this in pop())

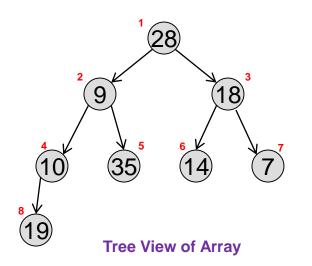

Tree View of Array

Converting An Array to a Heap

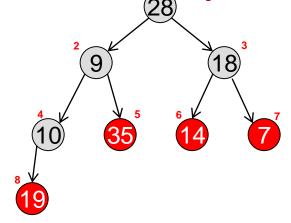

- To convert an array to a heap we can use the idea of first making heaps of both sub-trees and then combining the sub-trees (a.k.a. semi heaps) into one unified heap by calling heapify() on their parent()
- First consider all leaf nodes, are they valid heaps if you think of them as the root of a tree?
 - Yes!!
- So just start at the first non-leaf

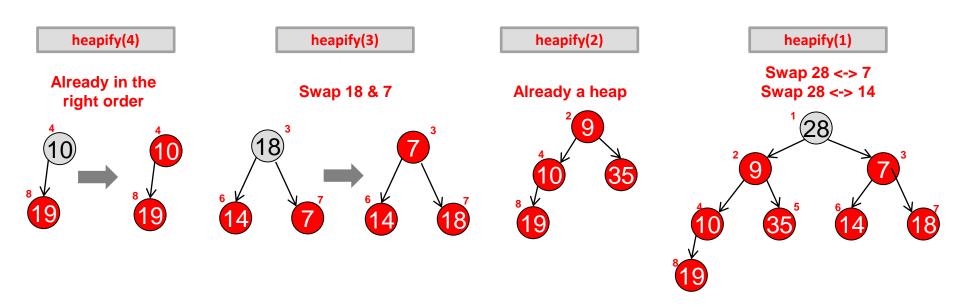

Converting An Array to a Heap

- First consider all leaf nodes, are they valid heaps if you think of them as the root of a tree?
 - Yes!!
- So just start at the first non-leaf
 - Heapify(Loc. 4)

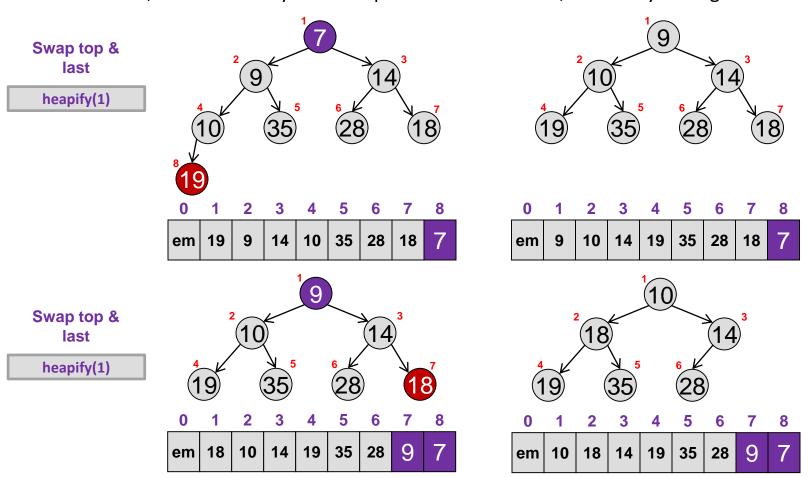

Leafs are valid heaps by definition

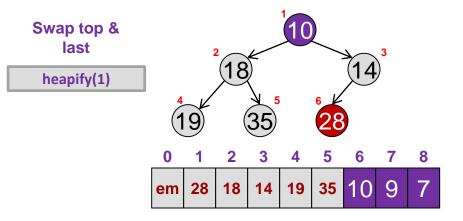

Converting An Array to a Heap

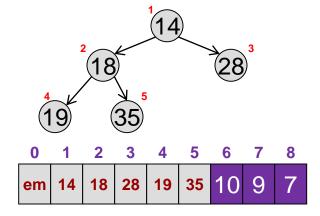

- Now that we have a valid heap, we can sort by top and popping...
- Can we do it in place?
 - Yes, Break the array into "heap" and "sorted" areas, iteratively adding to the "sorted" area

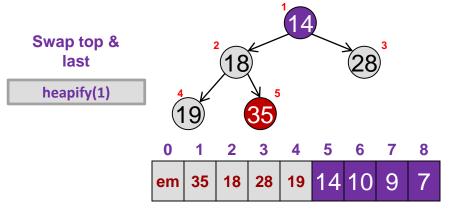

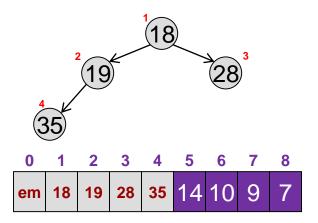

Sorting Using a Heap

- Now that we have a valid heap, we can sort by top and popping...
- Can we do it in place?
 - Yes, Break the array into "heap" and "sorted" areas, iteratively adding to the "sorted" area

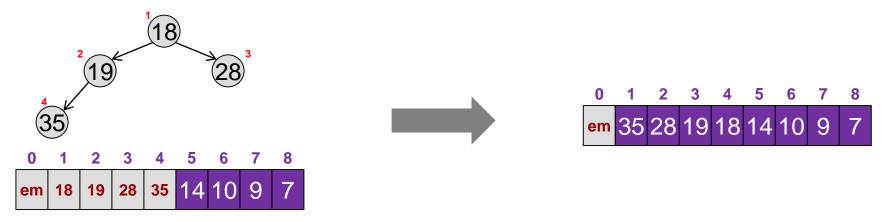

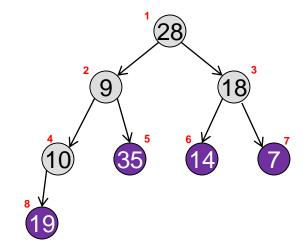

Sorting Using a Heap

- Notice the result is in descending order.
- How could we make it ascending order?
 - Create a max heap rather than min heap.

Build-Heap Run-Time

- To build a heap from an arbitrary array require n calls to heapify.
- Heapify takes O(______
- Let's be more specific:
 - Heapify takes O(h)
 - Because most of the heapify calls are made in the bottom of the tree (shallow h), it turns out heapify can be done in O(n)
 - n/2 calls with h=1
 - n/4 calls with h=2
 - n/8 calls with h=3
 - Totals: 1*n/2 + 2*n/4 + 3*n/8
 - $T(n) = \sum_{h=1}^{\log(n)} h * n * \left(\frac{1}{2}^h\right) = n * \sum_{h=1}^{\log(n)} h * \left(\frac{1}{2}^h\right)$
 - $T(n) = n * \theta(c) = \theta(n)$

Proving the Runtime of Build-Heap

- Let us prove that $\sum_{h=1}^{\log(n)} h * \left(\frac{1}{2}\right)^h$ is $\theta(1)$
- $T(n) = \sum_{h=1}^{\log(n)} h * \left(\frac{1}{2}\right)^h < \sum_{h=1}^{\infty} h * \left(\frac{1}{2}\right)^h$
- Now recall: $\sum_{h=1}^{\infty} (x)^h = \frac{1}{1-x}$ for x < 1 [x=1/2 for this problem]
- Now suppose we take the derivative of both sides
- $\sum_{h=1}^{\infty} h \cdot (x)^{h-1} = \frac{1}{(1-x)^2}$
- Suppose we multiply both sides by x:

$$x \cdot \sum_{h=1}^{\infty} h \cdot (x)^{h-1} = \sum_{h=1}^{\infty} h \cdot (x)^h = \frac{x}{(1-x)^2}$$

- For $x = \frac{1}{2}$ we have $\sum_{h=1}^{\infty} h \cdot \left(\frac{1}{2}\right)^h = \frac{\frac{1}{2}}{\left(1 \frac{1}{2}\right)^2} = 2$
- Thus for Build-Heap: $T(n)=n*\sum_{h=1}^{\log(n)}h*\left(\frac{1}{2}^h\right)=n*\theta(c)=\theta(n)$

Reference/Optional

C++ STL HEAP IMPLEMENTATION

- Implements a heap
- Operations:
 - push(new_item)
 - pop(): removes but does not return top item
 - top() return top item (item at back/end of the container)
 - size()
 - empty()
- http://www.cplusplus.com/refere nce/stl/priority_queue/push/
- By default, implements a max heap but can use comparator functors to create a min-heap
- Runtime: O(log(n)) push and pop while all other functions are constant (i.e. O(1))

```
// priority queue::push/pop
#include <iostream>
#include <queue>
using namespace std;
int main ()
  priority queue<int> mypq;
 mypq.push(30);
 mypq.push(100);
 mypq.push(25);
 mypq.push(40);
 cout << "Popping out elements...";</pre>
 while (!mypq.empty()) {
    cout<< " " << mypq.top();</pre>
    mypq.pop();
  cout<< endl;
 return 0;
```

STL Priority Queue Template

- Template that allows type of element, container class, and comparison operation for ordering to be provided
- First template parameter should be type of element stored
- Second template parameter should be the container class you want to use to store the items (usually vector<type of elem>)
- Third template parameters should be comparison functor that will define the order from first to last in the container

```
// priority_queue::push/pop
#include <iostream>
#include <queue>
using namespace std;

int main ()
{ priority_queue<int, vector<int>, greater<int>> mypq;
    mypq.push(30); mypq.push(100); mypq.push(25);
    cout<< "Popping out elements...";
    while (!mypq.empty()) {
        cout<< " " << mypq.top();
        mypq.pop();
    }
}

Code here will print
    25, 30, 100</pre>
Push(n):
Top(): Reference of the content of t
```

greater<int> will yield a min-heap less<int> will yield a max-heap

Output

Push(30)

Output

Pop(): Mimic heap::pop

C++ less and greater

- If you're class already has operators < or > and you don't want to write your own functor you can use the C++ built-in functors: less and greater
- Less
 - Compares two objects of type T using the operator
 defined for T
- Greater
 - Compares two objects of type T using the operator
 defined for T

```
template <typename T>
struct less
  bool operator()(const T& v1, const T& v2){
    return v1 < v2;
};
template <typename T>
struct greater
  bool operator()(const T& v1, const T& v2){
    return v1 > v2;
};
```

STL Priority Queue Template

- For user defined classes, must implement operator<() for maxheap or operator>() for min-heap OR a custom functor
- Code here will pop in order:
 - Jane
 - Charlie
 - Bill

```
// priority queue::push/pop
#include <iostream>
#include <queue>
#include <string>
using namespace std;
class Item {
public:
  int score;
  string name;
  Item(int s, string n) { score = s; name = n;}
  bool operator>(const Item &rhs) const
  { if(this->score > rhs.score) return true;
    else return false;
int main ()
  priority queue<Item, vector<Item>, greater<Item> > mypq;
  Item i1(25,"Bill");
                         mypq.push(i1);
 Item i2(5,"Jane"); mypq.push(i2);
  Item i3(10,"Charlie"); mypq.push(i3);
  cout<< "Popping out elements...";</pre>
  while (!mypq.empty()) {
    cout<< " " << mypq.top().name;</pre>
    mypq.pop();
```

More Details

- Behind the scenes std::priority_queue uses standalone functions defined in the algorithm library
 - push_heap
 - https://en.cppreference.com/w/cpp/algorithm/push_heap
 - pop_heap
 - https://en.cppreference.com/w/cpp/algorithm/pop-heap
 - make_heap
 - https://en.cppreference.com/w/cpp/algorithm/make heap

SOLUTIONS

Push Heap / TrickleUp

- Add item to first free location at bottom of tree
- Recursively promote it up while it is less than its parent
 - Remember valid heap all parents
 children...so we need to promote
 it up until that property is satisfied

```
void MinHeap<T>::push(const T& item)
{
   items_.push_back(item);
   trickleUp(items_.size()-1);
}

void MinHeap<T>::trickleUp(int loc)
{
   // could be implemented recursively
   int parent = loc/2;
   while(parent >= 1 &&
        items_[loc] < items_[parent] )
   { swap(items_[parent], items_[loc]);
        loc = parent;
        parent = loc/2;
   }
   Solutions at the
   end of these slides</pre>
```
